TOPIC 02 · USE COPILOT TO PLOT CHARTS

Lab 4 — Visualise Pay and Placement Distributions with Python in Excel

Maps to	LO2: use Copilot with Python in Excel to create distribution, relationship and heatmap visuals, review the generated code and verify plotted statistics with native formulas
Duration	35 minutes
Tools	Excel · Copilot (Allow editing, Chat only) · Python in Excel (=PY) · BrightPath_Contract_Placements.xlsx
Mock data	data/BrightPath_Contract_Placements.xlsx
Course	Microsoft 365 Copilot for Excel (C34) · v2.0

Goal

Show how contract bill rates, pay and margins are distributed across job levels and sectors, and explain one outlier, using Python visuals you have checked.

What You Will Do

BrightPath's flexible-staffing desk places contract associates with clients. You will ask Copilot to add a gross margin column, then create Python in Excel visuals - a box plot of bill rates by job level, a scatter of experience against pay with a trend line, and a sector-by-level margin heatmap. You will read the =PY code, re-compute a median and a correlation with Excel formulas, and investigate the highest pay rate.

What You Will Build

BrightPath_Contract_Placements.xlsx with a Gross_Margin_Pct column and, on Python_Charts, a box plot, a scatter with trend line, a margin heatmap and an outlier table - each with a native-formula check beside it

Prerequisites

- Lab 3 completed or equivalent charting experience.
- Python in Excel available: Formulas > Insert Python is visible (Windows, Mac or web; internet required).
- This lab folder's data/BrightPath_Contract_Placements.xlsx.

Data note

Use only the supplied fictional BrightPath data or information you are authorised to process. Do not paste credentials, confidential business material or real employees' personal data into Copilot.

Steps

Step 1. Go to onedrive.com (or your SharePoint site), open or create the folder work-c34 and select Upload > Files. Upload BrightPath_Contract_Placements.xlsx from this lab's data folder, then open it in Excel for the web or select Open in Desktop App. Confirm the title bar shows the cloud location and AutoSave is On, and that Formulas > Calculation Options is set to Automatic. Read the About_This_Data sheet before you prompt. Check that the Formulas tab shows Insert Python. If it does not, follow the fallback in Troubleshooting.

PROMPT / CHECK — copy and adapt

```
Table : tblPlacements (180 rows)
Levels : Junior | Mid | Senior | Lead
Output sheet : Python_Charts
```

Step 2. Choose Allow editing and ask for the margin column. Then ask Copilot to add the AVERAGE check and show one row's calculation.

PROMPT / CHECK — copy and adapt

```
Add a column Gross_Margin_Pct to tblPlacements = (Bill_Rate_Hourly - Pay_Rate_Hourly) /
Bill_Rate_Hourly,
formatted as a percentage with 1 decimal.

CHECK (Allow editing):
In an empty cell on Python_Charts, add this formula, tell me the result, and show the
Gross_Margin_Pct
calculation for the first row:
=AVERAGE(tblPlacements[Gross_Margin_Pct])
```

Step 3. Ask Copilot to create the box plot with Python. Ask it which table and columns the code uses and the order of levels. Then ask Copilot to add a native-formula check of the Lead median in the cell beside the chart.

PROMPT / CHECK — copy and adapt

```
Using Python in Excel, create a box plot of Bill_Rate_Hourly by Job_Level from tblPlacements,
ordered Junior, Mid, Senior, Lead. Put it in Python_Charts!B2. Title it
"Contract bill rate by job level (S$/hour)" and label both axes.

FOLLOW-UP: Which table and columns does the code in Python_Charts!B2 use, and in what order
are the levels?

CHECK (Allow editing):
In the cell beside the box plot, add this formula and tell me if it matches the Lead median in
the chart:
=MEDIAN(FILTER(tblPlacements[Bill_Rate_Hourly],tblPlacements[Job_Level]="Lead"))
```

Step 4. Ask for a scatter plot with a trend line and the correlation coefficient. Then ask Copilot to add the CORREL check.

PROMPT / CHECK — copy and adapt

```
Using Python, create a scatter plot of Years_Experience (x) against Pay_Rate_Hourly (y) from
tblPlacements, coloured by Job_Level, with a linear trend line. Also return the Pearson
correlation
coefficient in the cell below the chart.

CHECK (Allow editing):
In an empty cell below the scatter plot, add this formula and tell me if it matches the r you
returned:
=CORREL(tblPlacements[Years_Experience],tblPlacements[Pay_Rate_Hourly])
```

Step 5. Ask for a heatmap of average margin. Then ask Copilot to confirm the code uses the mean of Gross_Margin_Pct per cell.

PROMPT / CHECK — copy and adapt

```
Using Python, create a heatmap of the average Gross_Margin_Pct by Sector (rows) and Job_Level
(columns,
ordered Junior to Lead) with the values printed in each cell as percentages.

FOLLOW-UP: Does the heatmap code use the mean of Gross_Margin_Pct for each Sector and
Job_Level cell?
Show that line of code.
```

Step 6. Ask Copilot (Chat only) to find outliers with a stated rule, then look at the highest pay rate row. Decide whether it is an error, a genuine specialist rate, or needs checking with the desk - an outlier is not automatically wrong - and ask Copilot (Allow editing) to record your decision in Prompt_Log.

PROMPT / CHECK — copy and adapt

```
CHAT ONLY:
Using the IQR rule (above Q3 + 1.5 x IQR), list the Pay_Rate_Hourly outliers in tblPlacements
with
Placement_ID, Sector, Job_Level and Pay_Rate_Hourly. State Q1, Q3 and the upper fence. Show
the code.

ALLOW EDITING:
Add a row to Prompt_Log for the highest Pay_Rate_Hourly outlier with my decision:
<error / genuine specialist rate / check with the desk> and a one-line reason.
```

Step 7. In Chat only, ask Copilot to explain what the Python code in the box-plot cell does, then ask it to record all prompts and checks in Prompt_Log.

PROMPT / CHECK — copy and adapt

```
CHAT ONLY:
Explain the Python code in Python_Charts!B2 line by line in plain English.

LOG (Allow editing):
Prompt_Log already lists every prompt in this lab. For each one I ran, fill in What Copilot
did and
How I verified, and set Decision to Keep. I will tell you any row to change to Revise or Undo.
```

Sample Prompts

Use these prompts in the Copilot pane (or adapt them). Name the table and columns, state the output, and always verify the result. The same prompts are in sample-prompts.txt in this lab folder.

#	Purpose	Prompt
1	Calculated column	Add Gross_Margin_Pct = (Bill_Rate_Hourly - Pay_Rate_Hourly) / Bill_Rate_Hourly as a percentage.
2	Box plot	Using Python, create a box plot of Bill_Rate_Hourly by Job_Level ordered Junior, Mid, Senior, Lead.
3	Histogram	Using Python, create a histogram of Pay_Rate_Hourly with 15 bins and mark the median.
4	Scatter	Using Python, plot Years_Experience against Pay_Rate_Hourly with a linear trend line and return the correlation.
5	Heatmap	Using Python, create a heatmap of average Gross_Margin_Pct by Sector and Job_Level with values shown.
6	Outliers	Using the IQR rule, list Pay_Rate_Hourly outliers with Placement_ID, Sector and Job_Level, and state the upper fence.
7	Explain code	Explain the Python code in the selected cell line by line.
8	Direct answer	What are the median and mean Bill_Rate_Hourly by Job_Level? Show the code.

Test It

Expected results

Average Gross_Margin_Pct = 22.6%. The box plot shows four levels in order and the Lead median bill rate check returns S$65.74 (Junior S$22.72, Mid S$29.53, Senior S$41.70). CORREL returns about 0.49 - a moderate positive relationship. The heatmap shows Technology with the lowest average margin (~19.1%). The IQR rule flags 8 pay-rate outliers above about S$68.44; the highest is PL-5060 at S$173.47, and your Prompt_Log records a decision about it.

Checkpoint

Keep the workbook in work-c34. Topic 3 starts from the dashboard workbook in the Lab 5 folder.

Troubleshooting

If this happens	Fix
Insert Python is not visible or =PY returns an error.	Python in Excel needs a supported plan, Windows/Mac/web and internet. Fallback: ask Copilot in Chat only for the same visual (it is returned as a static image) and use Insert > Charts > Statistical > Box and Whisker for a native box plot.
The =PY cell shows a Python object instead of a picture.	Select the cell and change its output (the icon beside the formula bar) from Python Object to Excel Value, or click the card icon to view the image.
#BUSY! or a slow calculation.	Python runs in the Microsoft cloud. Wait, or select Formulas > Reset (Python) and recalculate.
Levels appear in alphabetical order (Junior, Lead, Mid, Senior).	Ask Copilot to set the category order explicitly to Junior, Mid, Senior, Lead.

Challenge

Ask Copilot, using Python, whether contracts that were Extended have a higher average Client_Rating than those that were not, with counts. Re-check the two averages with AVERAGEIFS.

Reflection

Which Python visual told you something a column chart of averages would have hidden?
